# NEW Gold 17 Heat Pump

American Standard will be making a change in the control circuit wiring to resolve a field reported issue of the EEV remaining powered when the Low Pressure Switch opens, which causes the system to pump down and lockout when low on refrigerant charge. The Low Pressure switch will now be wired in series with the high pressure switch and the EEV so that power will be removed from the EEV when either pressure control opens to remove power from the EEV and prevent a pump down and possible lockout of the system. While this has not been a cause of frequent customer complaints, the change will improve customer satisfaction with our systems until the system can be serviced.

**This control wiring change will not result in a change to price, product performance or system AHRI ratings.**

The 14th digit of the model number is being changed from “C” to “D” to reflect this new control wiring change.

Note: The current models will ship until the inventory of current models is depleted.
