

Introducing the New Odyssey Split System

American Standard is pleased to announce the introduction of the new Odyssey split systems. With this introduction, the constant volume systems will now comply with the DOE 2018 IEER requirements.

In addition to the redesign for higher IEER values, the Odyssey line will also incorporate a new Configured to Order (CTO) model number, similar to other products in the Light Commercial Unitary portfolio.

These new units are available now. Current inventory will be used before the new versions will be configured.

The March 2018 replication includes two new product families for Odyssey: ODY_I (Indoor) and ODY_O (Outdoor)

- ODY_I configures the TWE air handler size and options and pairs it with an outdoor unit for performance
- ODY_O configures the TTA/TWA condensing unit size and options
 - No performance is given from this product family, but be sure to select the same unit that you have selected for performance in the ODY-I family)

Support literature and demonstration videos are on the HUB. See [HUB Case 146535](#) for details.
