2018 DOE Compliant 7.5 Ton Precedent WSC Models

On July 15th (with Job Center Update #214), we will introduce 7.5 ton Precedent heat pump models (WSC090 & WSC092) that comply with the new Department of Energy minimums that changed from Full Load (11.0 EER) to Part Load (12.2 IEER). These models will have major design sequence change (**Digit 7=H**) and be **≈ +4% higher in price** than the models they are replacing (Digit 7=E) which will not be orderable after July 13th.

- WSC090H model is very similar to the WSC090E model it replaces. It has a single fixed speed compressor and belt drive constant volume indoor motor. It is intended for applications where first cost is the driver behind decision making.

WSC092H broadens our current offering. It has a 2 stage compressor and offers multiple airflow solutions including **MultiSpeed (Digit 15=7)** and **SZVAV (Digit 15=6)**

Why we're doing this:

- Compliance with new federal, state, and local regulations (especially 2 speed motors for ASHRAE 90.1-2013 or CA Title 24))
- Improvements to Safety/Serviceability & Quality

How it impacts our customers:

- Improved performance with MultiSpeed and Single Zone VAV options
- Complete offering of 7.5-10 ton heat pumps with airflow options (**6 tons coming soon**)
- WSC090E models remaining in inventory can still be sold at -4% lower prices.**
